                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1726
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1691
```

```
This nucleic acid sequence encodes the human purinoreceptor (HPURR), which has been shown to be similar to P2x purinoreceptors isolated from both human and rat. The nucleic acid was discovered from a spinal cord blat library (SCORMOTI) Incryte clone 555697, this was found by using a search for sequence alignments of amino acids. The consensus sequence was derived from the two overlapping and/or extended nucleic acid in the diagnosis, prevention, and treatment of disorders and diseases of the immune system, nervous system, cardiovascular, and of smooth muscle. For example, Alzheimer's, Huthinforn's, Parkinson's, Creutzfeldt-Jakob diseases, heart disease, troke, thrombosis and other coagulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          231

P2X polypeptides and polynucleotides are used to identify modulators, which may be used to treat and prevent pain, diseases of the nucroendocrine system, and auditory and vestibular disorders. P2X and P2X polynucleotides are a source of probes and primers, which may be used to identify homologous sequences, for gene localisation studies, and for gene therapy purposes. The polynucleotides may also be used to produce the polypeptide recombinantly. The P2X polypeptides are used to arise antibodies, and to identify inhibitors. The present sequence encodes human P2X4.
                                                                                                                                                                                                                                                                                                                                                                                                                        isolated polynucleotides, used to produce PX2 receptor polypeptides and identify potentially therapeutic compounds, encode a human P2X2 receptor polypeptide -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              175 AGGCTACCAGGAACTGACTCCGTGGTCAGCTCCGTTACGACCAAGGTCAAGGCGTGG

This cDNA encodes a human brain P2X-1 receptor polypeptide. The P2X receptor splice variants (P2X-1, P2X-2 and P2X-3 isoforms) can be recombinantly expressed by a host cell genetically neglneered with a recombinantly expressed by a host cell genetically neglneered with a vector containing the encoding nucleic acids. The receptors can be used to escreen for their antagonists. The products can be used to identify to screen for their antagonists. The products can be used to identify agents which modulate the activity of the receptors for use in clinical conditions such as brain stroke, brain or spinal cord traumas, infection and inflammation, cognitive disorders, epilepsy, affective and mood a disorders in general, including depression, various movement disorders including Parkinson's disease, Huntingtons Chorea and Schizophrenia, as well as those conditions that are associated with the development of chronic or acute forms of path, or cardiac anoxia. The products can also be used for detection, production of antibodies and production of transgenic animals as models for mutation and structure/activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TTTTCCAGTATGAGACGAACAAAGTCACTCGGATCCAGAGCATGAATTATGGCACCATTA 114

                                                                                                                                                                                                                                  Rat P2x clone 3 (AAF133853) codes for the superior cervical ganglion P2x receptor (AAF04216), a ligand-gated ion channel that opens upon binding of extracellular AFP. It was isolated by screening a rat testis cDNA bank with a probe obtd. by PCR amplification of testis cDNA using primers (see also AAF13857-58) based on the rat was deferens P2x receptor cDNA (AAF13852). A rat dorsal ganglion P2x receptor cDNA (AAF13854) was similarly isolated, and a human homologue (AAF13855) was also identified. The cDNA can be used to produce recombinant P2x receptors in host (e.g. COS) cells.

```
are potential therapeutic agents in several disorders including central nervous system or peripheral nervous system conditions, e.g., epilepsy, pain, depression, neurodegenerative disorders of the skeletal muscle such as neuromuscular diseases, disorders of the reproductive system, asthma, peripheral vascular disease, hypertension, immune system disorders, irritable bowel disorder, premature ejacularion, cystic fibrosis and chronic bronchits. P2Y purinoreceptors mediate the activity of extracellular nucleotide triphosphates to regulate chloride secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TGTTCGAGTACGACACGCCGCGCATCGTGCTCATCCGCAGCCGCAAAGTGGGGGCTCATGA 114

receptor splice variants (P2X-1, P2X-2 and P2X-3 isoforms) can be recombinantly expressed by a host cell genetically engineered with a vector containing the encoding nucleic acids. The receptors can be used to screen for their antagonists. The products can be used to identify agents which modulate the activity of the receptors for use in clinical conditions such as brain stroke, brain or spinal cord traumas, infection and inflammation, cognitive disorders, epilepsy, affective and mood disorders in general, including depression, various movement disorders including Parkinson's disease, Huntingtons Chorae and schizophrenia, as vell as those conditions that are associated with the development of chronic or acute forms of pain, or cardiac anoxia. The products can also be used for detection, production of antibodies and production of transgenic animals as models for mutation and structure/activity relationship evaluations as well as in drug screening. 1017 TCCAGCTGGTTGTGTACATCGGCTCAACCCTCTCCTACTTCGGTCTGGCCRCTGTGTTCA 1077 869 720 758 780 840 878 900 957 432 AGGCCIATGGCATCCGCTTCGACATCATTGTGTTTGGGAAGGCAGGGAAATTTGACATCA ------TGTACCTTCCACAAGACTCAGAATCCACAGTGTCCCATTTTCCGACTAG AAGTCTTCGGGATCCGTTTTGACATCCTGGTTTTTGGCACCGGAGGAAATTTGACATTA 313 CTTTGCAGGGGAACTCTTTCTTCGTGATGACAAACTTTCTCAAAACAGAAGGCCAAGAGC 373 AGCGGTTGTGTCCCCGAGTATCCCACCCGCAGGACGCTCTGTTCCTCTGACCGAGGTTGTA 433 AAAAGGGATGGATGGACCCGCAGAGCAAAGGAATTCAGACCGGAAGGTGTGTAGTRYATG 579 Teccacaaccrectritraaagecrecagaaaacricacretrirgerraagaacaaca 613 TCGACTTCCCCGGCCACAACTACACCACGAGAAACATCCTGCCAGGTTTAAACATCACT-699 ACCICAAGICGIGCAITIAIGAIGCIAAAACAGAICCCIICIGCCCCAIAIICCGICIIG GAGACATCTTCCGAGAAACAGGCGATAATTTTTCAGATGKGGCAATTCAGGGCGGAATAA 781 TGGGCATTGAGATCTACTGGGACTGCAACCTAGACCGTTGGTTCCATCACTGCCRTCCCA 841 AATACAGITICCRICGCCTIGACGACAAGACCAACGAGGTGTCCTIGTACCCTGGCTACA ACTICAGATACGCCAAGTACTACAAGGAAAACAATG---TTGAGAAACGGACTCTGATAA ATTICAGGTTTGCCAAGTACTACAGAGACCTGGCTGGCAACGAGCAGCGCACGCTCATCA 399 AGGGCCTGTGCCCCGAGATTCCAGATGCGACCACTGTGTGTAAATCAGATGCCAGCTGTA AAGGGAACCAGAAGACCTGTGAAGTCTCTGCCTGGTGCCCCATCGAGGCAGTGGAAGAGG CCCCCCGGCCTGCTCTTGAACAGTGCCGAAAACTTCACTGTGCTCATCAAGAACAATA DB 18; Length 1807; Sequence 1807 BP; 415 A; 507 C; 493 G; 392 T; 0 other; 322; .6e-52; 4; Mismatches Score 227.2; Pred No 7 6 Pred. The invention relates to detecting (MI) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (GS) identified by MR chip analysis as given in the specification, and comparing the expression level to an expression level in an unactivated GC, where differential expression of GS is indicative of GCA. Also included are modulating (M2) GA by contacting GC with an agent that alters the expression of at least one gene in GS: (2) screening (M3) for an agent capable of modulating GCA or an inflammation (especially CA or an agent capable of modulating GCA or an inflammation (especially CA coronic) in a tissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the gene expression profile; (3) detecting (M4) an inflammation (especially CA chronic) in a tissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the level of expression in a sample of the tissue of gene(s) from GS, where the level of expression in a sample of the tissue of gene(s) from GS, where
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (4) treating (MS) an inflammation (especially chronic) or in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by contacting a tissue having inflammation with an agent that modulates the expression of gene(s) from Gs in the tissue. MI is useful for detecting GA; MZ is useful for screening GA; MZ is useful for screening an agent capable of modulating GA preferably in an inflammation in a tissue; M4 is useful for detecting an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease (e.g. psoriasis, rheumatoid arthritis, glomerulonephritis, asthma, thrombosis, cardiac reperfusion injury, renal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             granulocyte activation by detecting differential expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 viral infection; parasitic infection; protozcal infection; fundal infection; sterile inflammatory disease; psoriasis; rheumatoid arthritis; glomerulonepiritis; asthma thrombosis; cardiac reperfusion injury; renal reperfusion injury; ARDS; adult respiratory distress syndrome; inflammatory bowel disease; crohn's disease; ulcerative colitis; periodontal disease; granulocyte activation; chronic inflammation; allergy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states

reperfusion injury, ARDS, adult respiratory distress syndrome, inflammatory bowel disease, Crohn's disease, ulcerative colitis, periodontal disease, also bacterial infection, viral infection, parasitic infection, protozoal infection, fungal infection and MS is useful for treating one of the above conditions. The present sequence represents a gene differentially expressed in granulocytes. Note: The sequence data for this patent did not form part
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DB 24; Length 2633;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     21;
                                                                                                                                                                                                                                                                                                 of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                     The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (1) a signature gene set, where (1) comprises a sequence (S) selected from 847 sequences (given in ABLG1664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AACTITCICAAAACAGAAGGCCAAGAGCAGCGGTTGTGTCCCCGAGTATCCCACCCGCAGG 404

It was isolated from a bladder CDNA library using a rat smooth muscle P2x receptor probe. Rat was deferens, superior cervical ganglion and dorsal root ganglion P2x receptor CDNAs (AAT3852-54) have also been isolated. These CDNAs can be used to produce recombinant P2x receptors in host, esp. mammalian, cells for use in screening (ant)agonist
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA encoding ATP P2x receptors of the purinoceptor family - for screening cpds. useful in treating epilepsy, cognition, emesis, pain, asthma, peripheral vascular disease, hypertension, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 203.8; DB 17; Length 2643;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a human expressed sequence tag (EST). The polynucleotide, which is a secreted EST, and the encoded protein tare predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haematopoiesis regulating activity, tissue growth activity, haematopoiesis regulating activity, tresque growth activity, haematopoiesis regulating activity, receptor/ligand activity, anti-inflammatory activity. Cadherin/tumour invasion suppressor activity, tumour invasion suppressor activity, tumour inhibition activity. The polynucleotide may also be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                             New polynucleotides encoding human secreted proteins - derived from e.g. human blood, kidney, foetal lung, placenta, testes, brain, ovary, pituitary, retina and colon cDNA libraries.

Patent No. 6133434
GENERAL INFORMATION
APPLICANT: BUELL, GARY N.
APPLICANT: SURPRENANT, ANNMARIE
APPLICANT: KAWASHITA, ERIC
TITLE OF INVENTION: A PURINBEGIC RECEPTOR
FILE REFERENCE: 1430-160
CURRENT APPLICATION NUMBER: US/08/342,079
CURRENT FILING DATE: 1997-04-28
NUMBER OF SEQ ID NOS: 20
SOFTWARE: Patentin Ver. 2.0
```

```
TITLE OF INVENTION: Nucleic Acids Encoding a Functional
TITLE OF INVENTION: Human Purinoreceptor P2X2 and P2X4 And Methods Of Production
TITLE OF INVENTION: Human Purinoreceptor P2X2 and P2X4 And Methods Of Production
TITLE OF INVENTION: And Use Thereof
FILE REPERBANCE: 6344.US. 11
CURRENT APPLICATION NUMBER: US/09/191,608
CURRENT FILING DATE: 1998-11-13
NUMBER OF SEQ ID NOS: 26
SOFTWARE: FastSEQ for Windows Version 3.0
